Corrected live in-progress replies

No placement

Both live trials kept the bottle on source

VoLoAgent → registered prompt → real VLA checkpoint → SONIC → MuJoCo + camera → Genon monitor

## Sample scene — mapping and camera checks pass

Both surfaces: 80 cm high. Table: 50 cm forward / 20 cm left.  
Stool: 35 cm forward / 60 cm right. Bottle: provisional geometry.

## Live frame verdicts before and after the criterion fix

## Independent object truth in the corrected trial

## Turning still needs work

## What is checked, and what remains

|         |                                                 |
|---------|-------------------------------------------------|
| PASS    | Policy stall interrupts with confirmed hold     |
| PASS    | Fresh late result during reset is discarded     |
| PASS    | Recorded vision: 8 negatives, 0 false-completes |
| OPEN    | Calibrated grasp + released placement           |
| OPEN    | Repeatable turns + carried-bottle occlusion     |
| OPEN    | 172 training episodes still need outcome review |
| PENDING | Supervised hardware; dashboard deferred         |

The corrected criterion resolves the observed false-success case. These small sets do not establish general reliability.
